

MetricFlow Penetration Test Summary

Simulated vendor evidence | Web application and external infrastructure

SIMULATED DOCUMENT FOR PUBLIC PORTFOLIO USE

Test date	February 10, 2026
Scope	Production web application, public API, and external infrastructure
Method	Authenticated and unauthenticated testing
Critical findings	0
High findings	0
Medium findings	2 open
Low findings	3 closed

Open findings

ID	Finding	Risk	Status	Target
PT-04	Rate limiting is inconsistent on two reporting API endpoints.	Medium	Fix deployed; independent retest pending	Sep 25, 2026
PT-07	Session termination does not immediately revoke an active API token in one legacy workflow.	Medium	Code fix in validation	Sep 25, 2026

Controls considered

- A web application firewall monitors and blocks common exploit patterns.
- Security events are sent to the central SIEM for alerting and investigation.
- The affected API tokens have scoped permissions.
- No evidence of exploitation was identified during the test.

Required evidence for closure

- Independent retest results confirming both Medium findings are resolved.
- Updated configuration or code evidence for each fix.
- Closure approval from the vendor security owner.

Assessment note

The absence of Critical or High findings reduces immediate exposure, but both Medium findings are past the original vendor target date. They remain open in the risk register until retest evidence is validated.
